Animal Products :

THE MEAT SUPPLY OF GHANA

By
St. John A. Clottey
Research Officer

ANIMAL PRODUCTS SECTION

Food Research Institute, P.O. Box M-20, Accra.
July 1969.

PREFACE

This paper represents an attempt to present a more complete picture of the meat supply of Ghana than had been done in the past. In my Special Report No. 1 - "Production & Utilization of Animal Products in Ghana" published in April, 1968 and a subsequent cyclostyled material "Ghana: Selected Production and Trade Data on Animal Products" of November 1968, the values presented were based entirely on the then known and recorded production and trade data of the time. Thus values for usually unrecorded internal production and consumption (such as unofficial slaughters) were not included in the computations. However, with this material now available, a further attempt is being made to fill the gap, and broaden the scope of the subject as well as improve its organization and presentation.

I am greatly indebted to the Animal Health Division of the Ministry of Agriculture for supplying the data on the local production and the Central Bureau of Statistics for the figures on importation.

St. John A. Clottey

Accra
July 1969.

Definitions

The term "meat" as used in this paper refers to the edible portion of the carcasses and the edible offal of cattle, sheep, goat and pig, otherwise referred to as beef (including veal) mutton (including lamb), goat meat and pork.

By "edible portion of the carcass" is meant the following:

- a) the lean or muscle part of the carcass - with its associated connective tissue, blood vessels, nerves and residual body fluid;
- b) fat - in all forms - subcutaneous, inter-muscular and intra-muscular, etc.

Edible offal comprises mainly visceral organs. These include the spleen, liver, heart, kidney, lung, stomach and intestine. Others are parts of the head (including the brain, tongue, the cheek meat), shanks, tail, and to a less-extent, hides.

The term meat as used here, does not include poultry, game or wildlife or any other source of animal food not identified in this paper. It excludes also synthetic animal foods and animal food substitutes.

Structure of the Meat Supply of Ghana

Ghana's supply of meat is drawn from both the local production and import sources. Importations furnish meat in three forms :

- a) as live animals for slaughter in local abattoirs : this source of meat has been referred to in this paper as official slaughterers (import);
- b) as prepacked carcass meat; and
- c) as processed meat products.

The local supply, drawn of course, from the national livestock herd, comprises mainly of freshly slaughtered meat - very little of which is processed. The local supply may be classified into two varieties :

- a) meat from official slaughterers, designated herein as official slaughterers (domestic), and
- b) meat from unofficial slaughter sources.

The term "official slaughter\$" refers to slaughters conducted in recognized, local government-supervised slaughter-houses and slabs. Meat, in this instance, is subjected to official inspection, quantification and marketing and health regulations.

"Unofficial slaughters", by contrast, are conducted outside official slaughter-houses - usually without the official knowledge of the local government authority. They include all forms of private and ceremonial slaughters both at the household and communal level. Since unofficial slaughters necessarily escape official quantification, the values and yields indicated in this report have been arrived at by estimation. A full discussion of the methods involved is presented below.

Conversion Factors and Evaluation Indices

Official Slaughters

Ghana maintains a fairly accurate and consistent record of the total official slaughters in the country - although the source of animals (i.e. whether from domestic or import outlets is not indicated in the records). At the same time, records are kept of all importations of live animals. And although a certain proportion of these imports are held for breeding purposes, by far, the greater percentage (perhaps about 98) is slaughtered annually for consumption. Because the numbers held for breeding is small, it has been assumed (for purposes of this paper) that all animals imported into Ghana are slaughtered for food. However, since the overall national slaughters usually exceed importations, a further assumption has been made that this excess is equivalent to extraction from the national herd for official slaughters (domestic).

We may illustrate these series of discussions with the case for cattle in the year 1962.

TABLE A

Estimation of Official Slaughters(Domestic)

	<u>x 10³</u>
* Total cattle population	468.0
* Total national slaughters	108.7
** Live Imports, i.e. official slaughters (import)	96.5

* Source: Animal Health Division, Ministry of Agriculture, Accra.

** Source: External Trade Statistics, Dec., 1962, Central Bureau of Statistics, Accra.

∴ Official slaughters (domestic) = 108.7 - 96.5 = 12.2.

A complete table of the total national slaughters of all species for the period, 1961-67 is presented in Table E.

Unofficial Slaughters

The estimation of unofficial slaughters require a more elaborate process. The method employed here is a modified version of one originally proposed by the FAO (1949). Known as "livestock balance", the calculation takes into consideration such factors as the mortality rate and the reproduction rate - and which values as indicated for Ghanaian livestock (Table C) are estimates based on an observation of the performance of these animals.

Below, the method of calculation is presented for cattle in the year 1962.

TABLE B

Estimation of Unofficial Slaughters

Total cattle population, 1962	468,000
Number of cows (as % of total population, 10% = $468,000 \times 40\% =$)	187,280
Births (calving rate, $40\% \times$ no. of cows = $40\% \times 187,280$) .	74,912
Deaths (mortality rate, $5\% \times$ total pop. = $5\% \times 468,000$) .	23,410
Excesses of births over deaths ($74,912 - 23,410$) . .	51,502
Increase in cattle population in 1963 (1963 pop. - 1962 pop.) or $476,600 - 468,000$	8,400
Official Slaughters in 1962	12,190
Total known extraction and left overs ($8,400 + 12,190$) = 20,590	

∴ Total unknown (or unofficial extraction) $51,502 - 20,590 = \underline{\underline{30,912}}$.

NOTE

The value for unofficial slaughters as obtained by this method, if added to official slaughters (domestic) as well as to the numbers of animals left unslaughtered, will not necessarily tally up with the official census returns for the year. This is because among certain species such as the pig, the rates of reproduction and growth are extremely high, thus necessitating ~~the~~ early marketing of the animals and ~~their~~ inevitability to escape official count at the time of the census. Thus readers will find, for example, that although the census returns for pigs in 1961 totalled 49,000, the sum of unofficial and official slaughters for the same year was 56,300 or an extraction rate of 114.9%!

TABLE C
Estimated Production Values for Ghanaian Livestock

	<u>Reproducing females</u> (As % of total population of the species)	<u>Reproduction rate</u> (As % of the pop. of reproducing females)	<u>Mortality rate</u> (As % of total pop)
Cattle	40	1961-64: 1965-67:	40 45
Sheep	30	200	5
Goat	20	400	7
Pig	10	1,200	4

Meat Yield

The term meat yield refers to the total edible meat of the species. It is made up as follows: the edible portion of the carcass, and the edible offal. For cattle slaughtered in Ghana (Aver. wt. 500 lb) the meat yield averages 275 lb. or 55% of live animal weight. (see Table D). This is calculated as follows, given the following:

$$\begin{aligned} \text{Average live weight of cattle} & \dots \dots \dots = 500 \text{ lb.} \\ \text{Carcass wt., } 50\% \text{ of live wt.} & \dots \dots \dots = 250 \text{ lb.} \end{aligned}$$

	<u>Quantity</u>	<u>Protein Content</u>
Edible portion of carcass (72% of carcass wt.)	= 180 lb.	20%
Edible offal (20% of live wt.)	= 100 lb.	19%
∴ Edible Portion Equivalent = $180 + \left(\frac{19 \times 100}{20} \right)$		
	= 275 lb.	

This edible portion equivalent, based on the work of Bredon & Marshall (1959) is a measure of the total edible meat, and has been obtained by adjusting the protein content of the offal to that of the edible portion of the carcass, and then adding the adjusted offal weight to the weight of the edible portion of the carcass.

By multiplying the E.P.E. with the total number of animals slaughtered, the overall yield of meat is obtained. For the 1962 unofficial slaughterers, therefore, the meat (beef) yield is $275 \times 30,912 =$ ~~8.50~~ 8.50×10^6 lb. or 3.80×10^3 tons.

Per Caput Meat Availability

If the values of all slaughterers as well as their protein values are known and the total human population is also known, then one could proceed to work out the per capita meat and meat protein availability for the country.

For slaughter beef, the situation is as follows:

<u>Period: 1961-67</u>	<u>$\times 10^3$</u>
Average unofficial slaughterers	30.0
Average official slaughterers (domestic)	24.1
Average official slaughterers (import)	82.2
Total slaughterers	136.3

Average annual human population for the period 1961-67 = 7.5×10^6

Calculation

a) Total beef availability : $275 \times 136.3 \times 10^3 = 37.48 \times 10^6$ lb.

Availability of slaughter beef/
caput/year: $\frac{37.48 \times 10^6}{7.5 \times 10^6} = 4.997$ lb.
=====

b) Slaughter beef protein availability/
caput/day:

From Edible Portion (gram)

$$\frac{180 \times 136.3 \times 10^3 \times 45\% \times .20}{7.5 \times 10^6 \times 365} = 0.8137 \text{ gram}$$

From Edible Offal (gram)

$$\frac{100 \times 136.3 \times 10^3 \times 45\% \times .19}{7.5 \times 10^6 \times 365} = 0.04295 \text{ gram}$$

∴ Overall slaughter beef protein avail./caput/day, gram

$$= 0.8137 + 0.04295 = 0.8567 \text{ gram}$$

NOTE

This method of determining the per caput meat and meat protein availability is being offered merely as a piece of information, and no values of the nature have been presented in this report.

TABLE D

Average Values for Yield of Meat & Quantity
of Protein in Ghanaian Livestock

	<u>Cattle</u>	<u>Sheep</u>	<u>Goat</u>	<u>Pig</u>
Live Weight, lb.	500	35	50	100
Carcass Wt., lb.	250	24.5	35.0	85
Edible Portion of Carcass (E.P.), lb.	180	17.2	26.3	72.3

SECTION 3

SUMMARY OF FINDINGS

This study, taking into consideration estimated values of usually unquantified domestic slaughters in Ghana, arrives at a value of approximately 29,000 tons as the average annual total quantity of meat available for consumption in Ghana for the period, 1961-67. The breakdown of this is as follows:

AVERAGE ANNUAL AVAILABILITY OF MEAT
FOR THE PERIOD, 1961-67

BY SPECIES			BY TYPE		
	<u>Quantity</u>	<u>%</u>		<u>Quantity</u>	<u>%</u>
	<u>x 10³ tons</u>			<u>x 10³ tons</u>	
BEEF	17.2	60	UNOFFICIAL SLAUGHTERS	7.2	25
MUTTON	3.4	12	OFFICIAL SL. (DOMESTIC)	3.9	13
GOAT	3.7	13	OFFICIAL SL. (IMPORT)	11.6	41
PORK	3.3	11	PREPACKED CARCASS	2.0	7
MISCEL.	1.3	4	PROCESSED MEAT	4.2	14
Total	28.9	100	Total	28.9	100

The availability of meat over the period ranged from 41,000 tons for 1961 to 24,000 tons for 1965. For 1967, the quantity of supply was valued at 25,000 tons.

Approximately 40% (or 11,000 tons) of the total supply is drawn from the domestic production, while the remaining 60% (18,000 tons) is derived from importation.

6.3 On the average, the per capita availability for meat amounted to 8.6 lb. annually - the mean annual human population for the period, being of the order of 7.5 million.

Cost : The C.I.F. value of all imported reached a level of approximately N£9.30 million annually. Of this about N£6.5 million was spent on live animals, N£2.1 million on processed meat and N£700,000 on prepacked carcass meat.
